Summer means more insect invasions

Cockroaches and crickets, rats and mice, ants and spiders – all unwanted guests that creep and crawl into every crack and crevice of apartments and homes.

The summer months are a busy time for pest control companies because insects are more likely to invade homes when the weather is warm and moist.

ANTS pop up all the time during the rainy season because they live in the ground. When it rains, the floods bring them out and up above ground. That is when you get the mounds above ground to protect the eggs.

New housing developments, especially those built in areas that were previously wooded or rural are highly prone to various types of vermin including ants, spiders and rodents.

In a new housing area bugs have no where to go. Your home is their home.

And though it may be disturbing for apartment dwellers to see ants march one by one up their kitchen wall or a cockroach lying upside down on the bathroom floor, it is normal to find more insects in apartments rather than a single family home.

One reason apartments sometimes seem over run with creepy crawlers is because so many people are moving in and out and many are bringing in furniture that has been stored for a period of time and may be infected with insects.

To keep homes fairly bug-free, follow simple sanitation and maintenance rules. However, no home is ever completely safe from pesky pests.

Being an apartment dweller or homeowner, you are going to have to deal with pest control problems at one time or another.

NO MATTER HOW CLEAN YOU ARE IT IS JUST NATURE TAKING ITS COURSE.
